Customer Journey Map

Project: Global Olympic Sports Performance Analysis | User: Olympic performance analyst / sports data storyteller

Project owner: Sendhika Vishwakarma

Goal: use the dashboard to understand country performance, compare sport and investment-tier measures, and explain Games-level patterns with appropriate caveats.

Journey Stage	User Action / Question	Pain Point	Dashboard Support / Opportunity
1. Discover	Needs a quick overview of Olympic performance.	Data is spread across several CSV files.	Open the single dashboard and read its three scenario sections.
2. Explore national performance	Compare countries and sport categories.	Raw totals can hide participation differences.	Use country medal leaderboard, average medals per athlete, and medalist-rate views.
3. Compare investment tiers	Ask how output and reported efficiency differ by tier and region.	Investment is categorical, and the efficiency formula is not documented.	Compare the tier and region charts; treat the metric as descriptive, not verified ROI.
4. Tell the Olympic story	Review medal totals by edition, host performance and regional share.	Historical rows and host labels may need verification.	Use Games trend, host-country medals and regional share; validate source records.
5. Communicate findings	Prepare a summary for discussion or presentation.	Risk of overstating causation or treating source data as official.	Use chart titles, clear definitions, validation notes and project documentation.
6. Improve / follow up	Identify questions requiring further analysis.	The dashboard cannot explain causes or spending amounts absent from data.	Request verified source data, a documented efficiency formula and additional context.

Success Criteria

- Users can locate each view quickly, and each chart has a clear question and measure.
- Comparisons preserve dataset grain and caveats; findings can be traced to the supplied CSV files.
